How to find parameter values to a method?

Posted by ponsakthi - 01 Sep 2011 - 20:53

Hi all,

I faced an .net exception in my application in the customer machine.
Without closing the exception I attached Windbg and I saw the clrstack.

The method in which exception has occurred accepts a string as an parameter.

But I am not able to identify the value of paramater in !clrstack -p as well.It shows as no data.

Please help me out.

Hi,

!dso should show you all the objects on the managed stack. You'll find your string there.

Cs.
